

Project Coordination

Well organised management of both technical and non-technical work programmes is vital to the success of exploration projects. In the changing economic climate and nature of the mining industry, investors and are looking for more than geologically robust exploration and a deposit of merit. Exploration companies now need to demonstrate that investment is used effectively to advance a project quickly and comprehensively without undue expenditure.

By employing dedicated project coordinators, geologists are able to focus on the technical challenges of developing a mineral deposit, rather than having to dedicate time to the day-to-day challenges of budgets, contracts, logistics and stakeholder engagement.

SRK ES offers:

Experience of coordinating small reconnaissance trips involving a few geologists and local guides, through to much larger projects involving semi-permanent camps, over 100 technical and support staff and multiple simultaneous exploration work programmes for many months. Dedicated project coordinators are vital in the proper management of such diverse projects, particularly in infrastructure and resource poor areas in which mineral exploration so frequently happens.

Scheduling and budget control to ensure that phases of work are completed in a timely manner and do not incur additional overrun costs. Coordinating multiple field teams, contractors and local staff to efficiently collect field data critical to the technical advancement of the project has to be balanced with monitoring stock levels, reporting deadlines and keeping clients informed on progress.

SRK ES is well suited to organising and implementing comprehensive technical programmes of work that rigorously test the geological credentials of deposits. SRK ES can provide experienced project managers to coordinate the multitude of activities vital to the effective and cost efficient progress of a project.

Expertise in identification of specialist technical contractors and negotiation of contracts for items such as drilling, geophysical surveys and assay of samples at geochemical laboratories. SRK ES provides such advice and makes decisions and recommendations based on sound technical understanding of what is needed to develop the project, coupled with commercial knowledge and an understanding of the budgetary and time constraints of the project.

Liaison and engagement with all key stakeholders at regular intervals to ensure they are kept informed of exploration activities that affect them. This includes any mandatory governmental meetings or reporting as well as discussions with local communities who's livelihoods will likely be impacted significantly by the changes and opportunities provided by exploration and possible future mining activities.
